

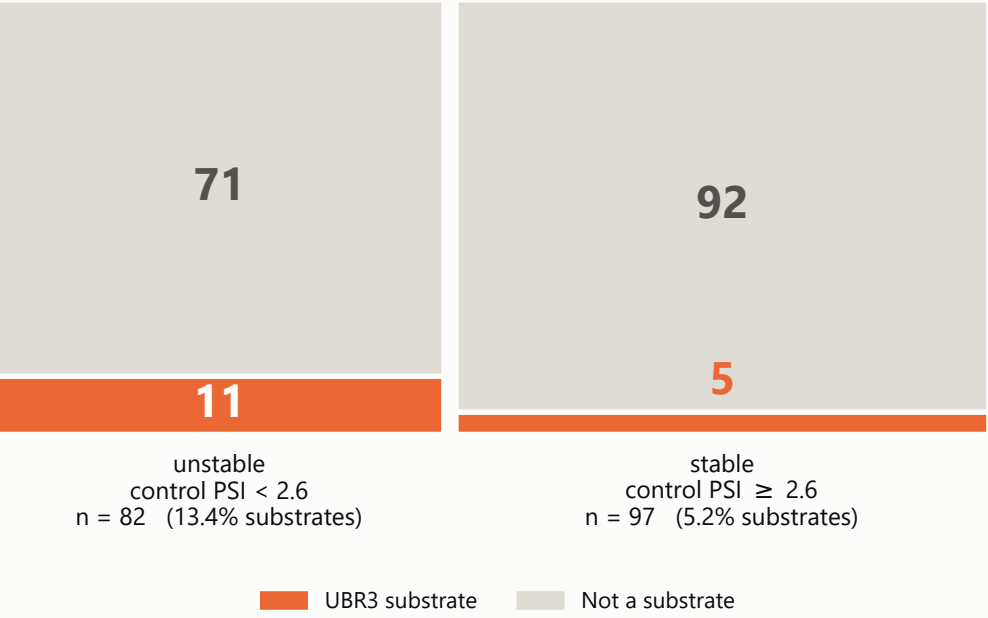

Figure 9 | Motif-bearing peptides classified by baseline stability and substrate status
Every [P/G]-[E/D] peptide falls into one of four cells: unstable or stable at control PSI 2.6, and a UBR3 substrate or not. 11 of the 16 substrates start unstable; the remaining 5 were already stable and gained further stability on UBR3 loss. The unstable-vs-stable difference within the motif class is directional only (Fisher OR 2.85, $p = 0.067$) - it is the motif, not the stability class, that is strongly significant.

A

The 179 [P/G]-[E/D] peptides, classified two ways

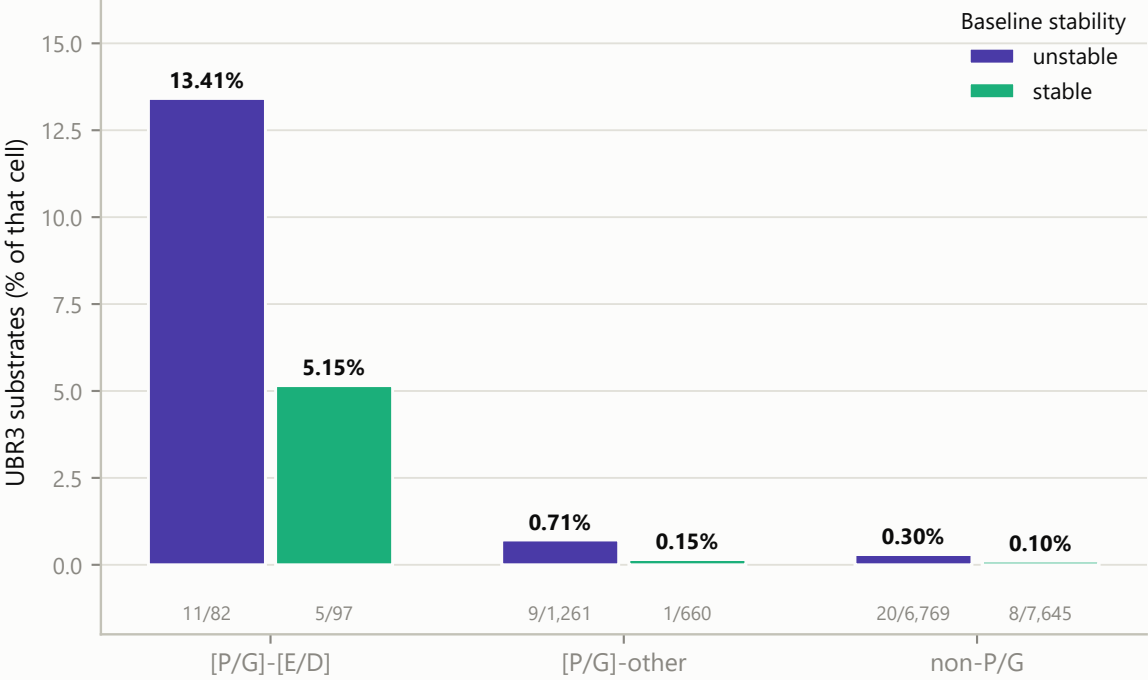

Column width is the share of peptides in that stability class; height is substrate share

B

Substrate rate in each stability x motif cell

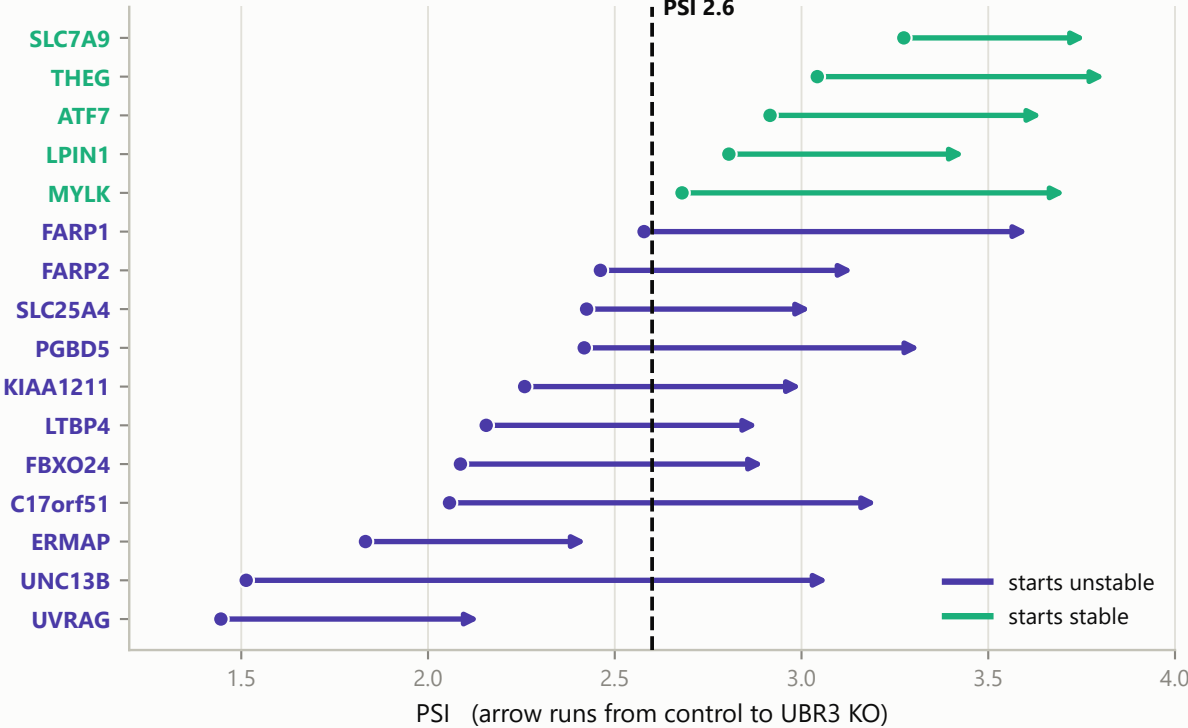

Counts under each bar are substrates / peptides in that cell

C

Every motif-bearing substrate gains stability

Each arrow runs from control PSI to UBR3-KO PSI; all 16 point right

D

Where the 179 motif-bearing peptides end up

11 of the 16 substrates start unstable; the other 5 were already stable and gained more
