

Residue frequency by position — the 193 non-substrate controls (background panel)

same matrix, same 0–35% scale, for the controls · what the substrate panel has to be read against

Colour and cell text are the same number: the percentage of the n = 193 non-substrate controls carrying the same motif with that residue at that position (one peptide = 0.52%). Blank = 0%, no peptide in the group. Rows are alphabetical; the chip beside each label is its chemical class. This is composition, NOT enrichment — a residue frequent here may be just as frequent among the substrates. This is the background panel: the same matrix, on the same colour scale, for the controls. Compare with Figure 18 / 19 for the other group, and with Figures 16–17 for significance.
