
Volcano Plot — Moderated t-test (limma-style empirical Bayes) + BH FDR
Best Hits coloured by Position 2 residue (n = 16,514 peptides, prior d.f. d0 = 9.6)
Moderated t-test (Smyth 2004)
prior s_0^2 = 0.013
prior d.f. d_0 = 9.6
moderated d.f. = $d_g + d_0$ = 11.6
BH FDR:
FDR<0.05: 105 genes
FDR<0.10: 333 genes
Cutoffs: |ΔPSI| ≥ 0.5, FDR < 0.05
→ 43 up, 16 down
ΔPSI = -0.5
ΔPSI = 0.5
FDR = 0.05
