

Amino-acid class composition of the Pro/Gly substrates against the library

Panel A is the 26 substrates carrying Pro or Gly at position 2. B is the P/G-matched library background and C the whole library. D tests A against B, which is the comparison that removes the position-2 selection.

A

Amino-acid class composition at each position - 26 UBR3 substrates with Pro/Gly at position 2

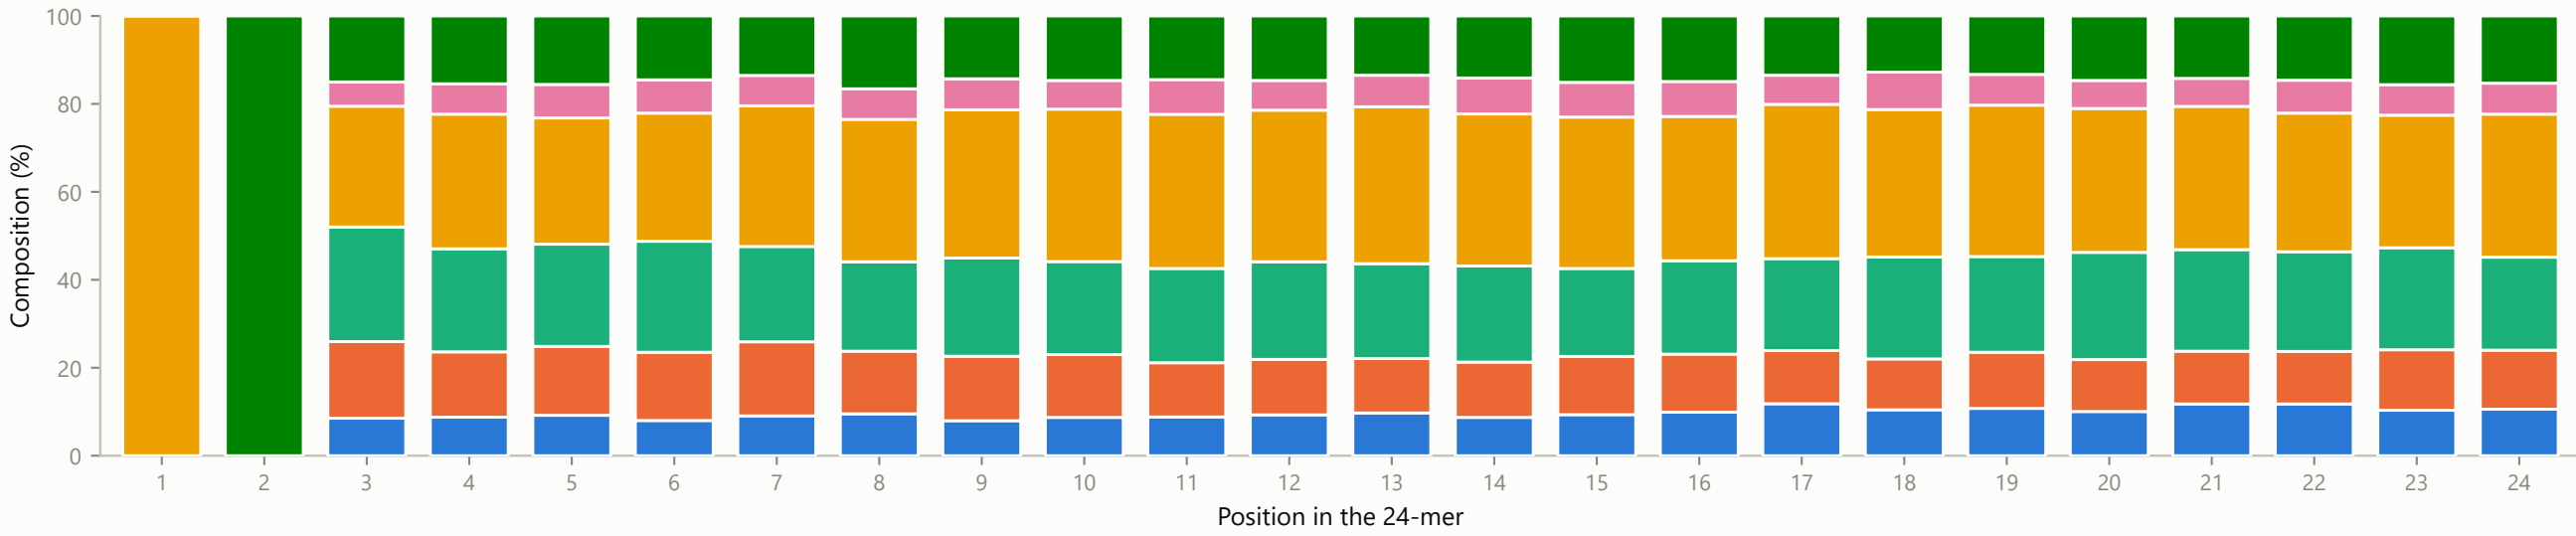

Position 2 is Pro or Gly by definition (14 Gly, 12 Pro); position 3 is 42% Acidic

B

Amino-acid class composition at each position - 2,100 library peptides with Pro/Gly at position 2

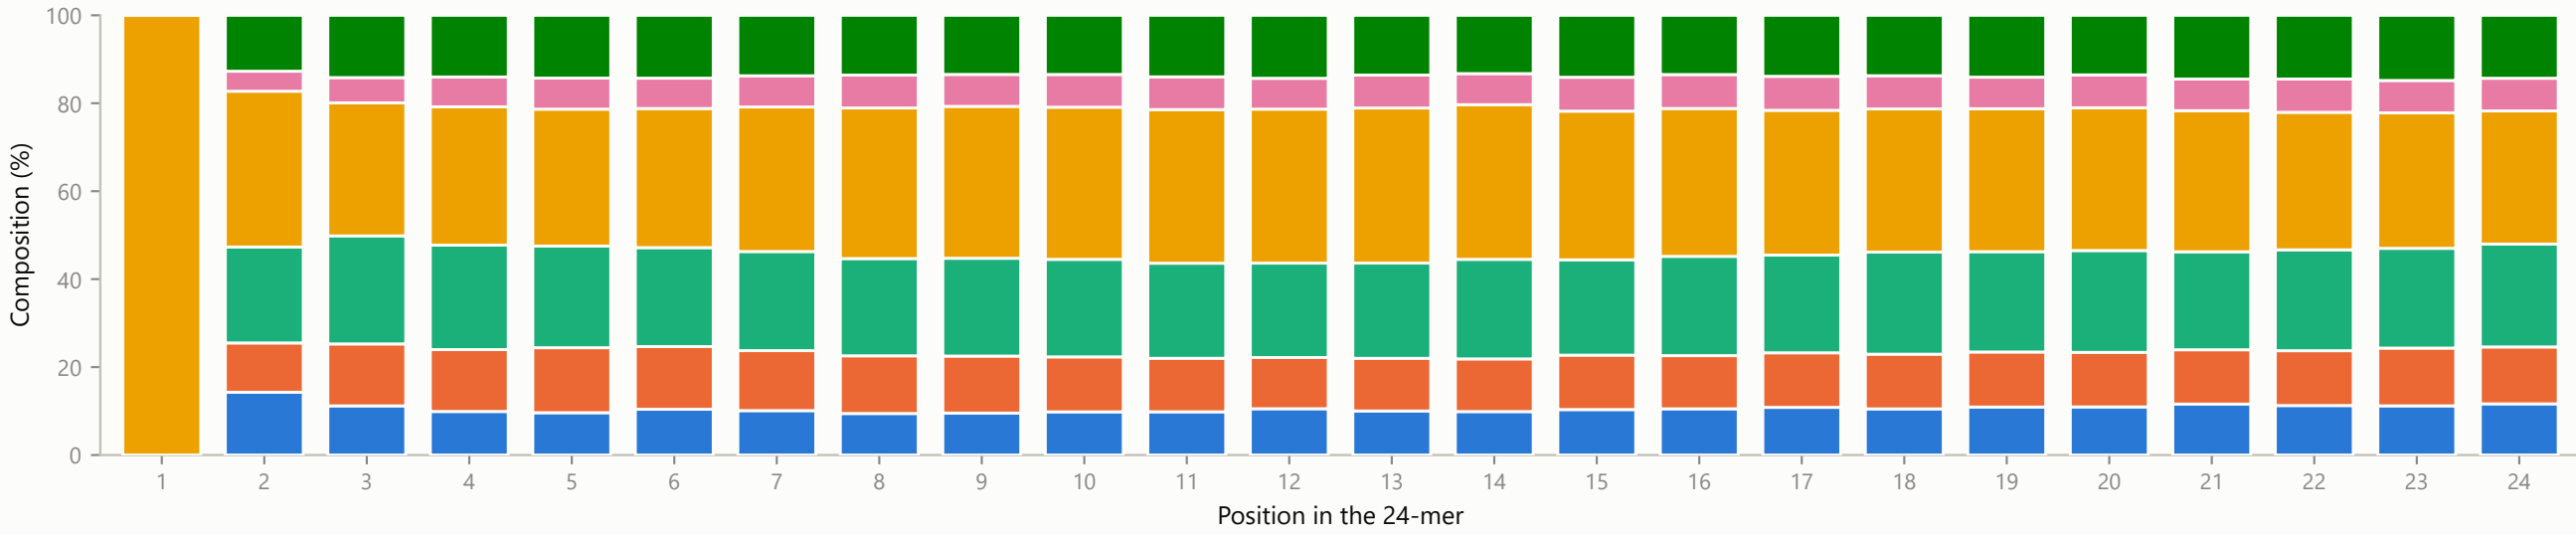

The motif-matched background: same position-2 constraint, no selection for UBR3 dependence

C

Amino-acid class composition at each position - 16,514 library peptides (whole library)

The global background, for reference - position 2 here is unconstrained

D

P/G substrates vs the P/G-matched library (FDR-masked)

Beige = not significant. 1 of 144 cells survive q < 0.05 - only Acidic at position 3. Beyond position 3 the substrates match their own background.
