

Pro/Gly substrates versus Pro/Gly non-substrates

Both groups carry Pro or Gly at position 2, so that selection cannot drive any difference. 26 substrates against the 2,074 P/G peptides that are not substrates.

A

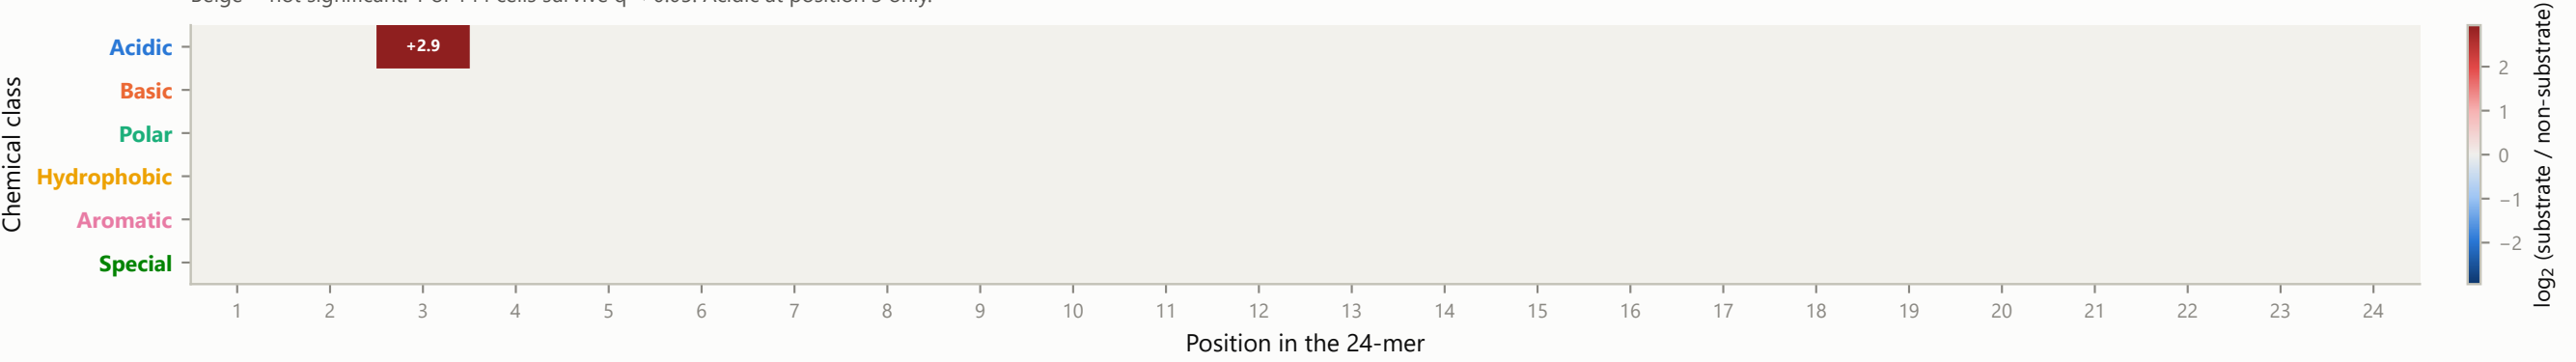

B

C

Class enrichment, substrates vs non-substrates (FDR-masked)

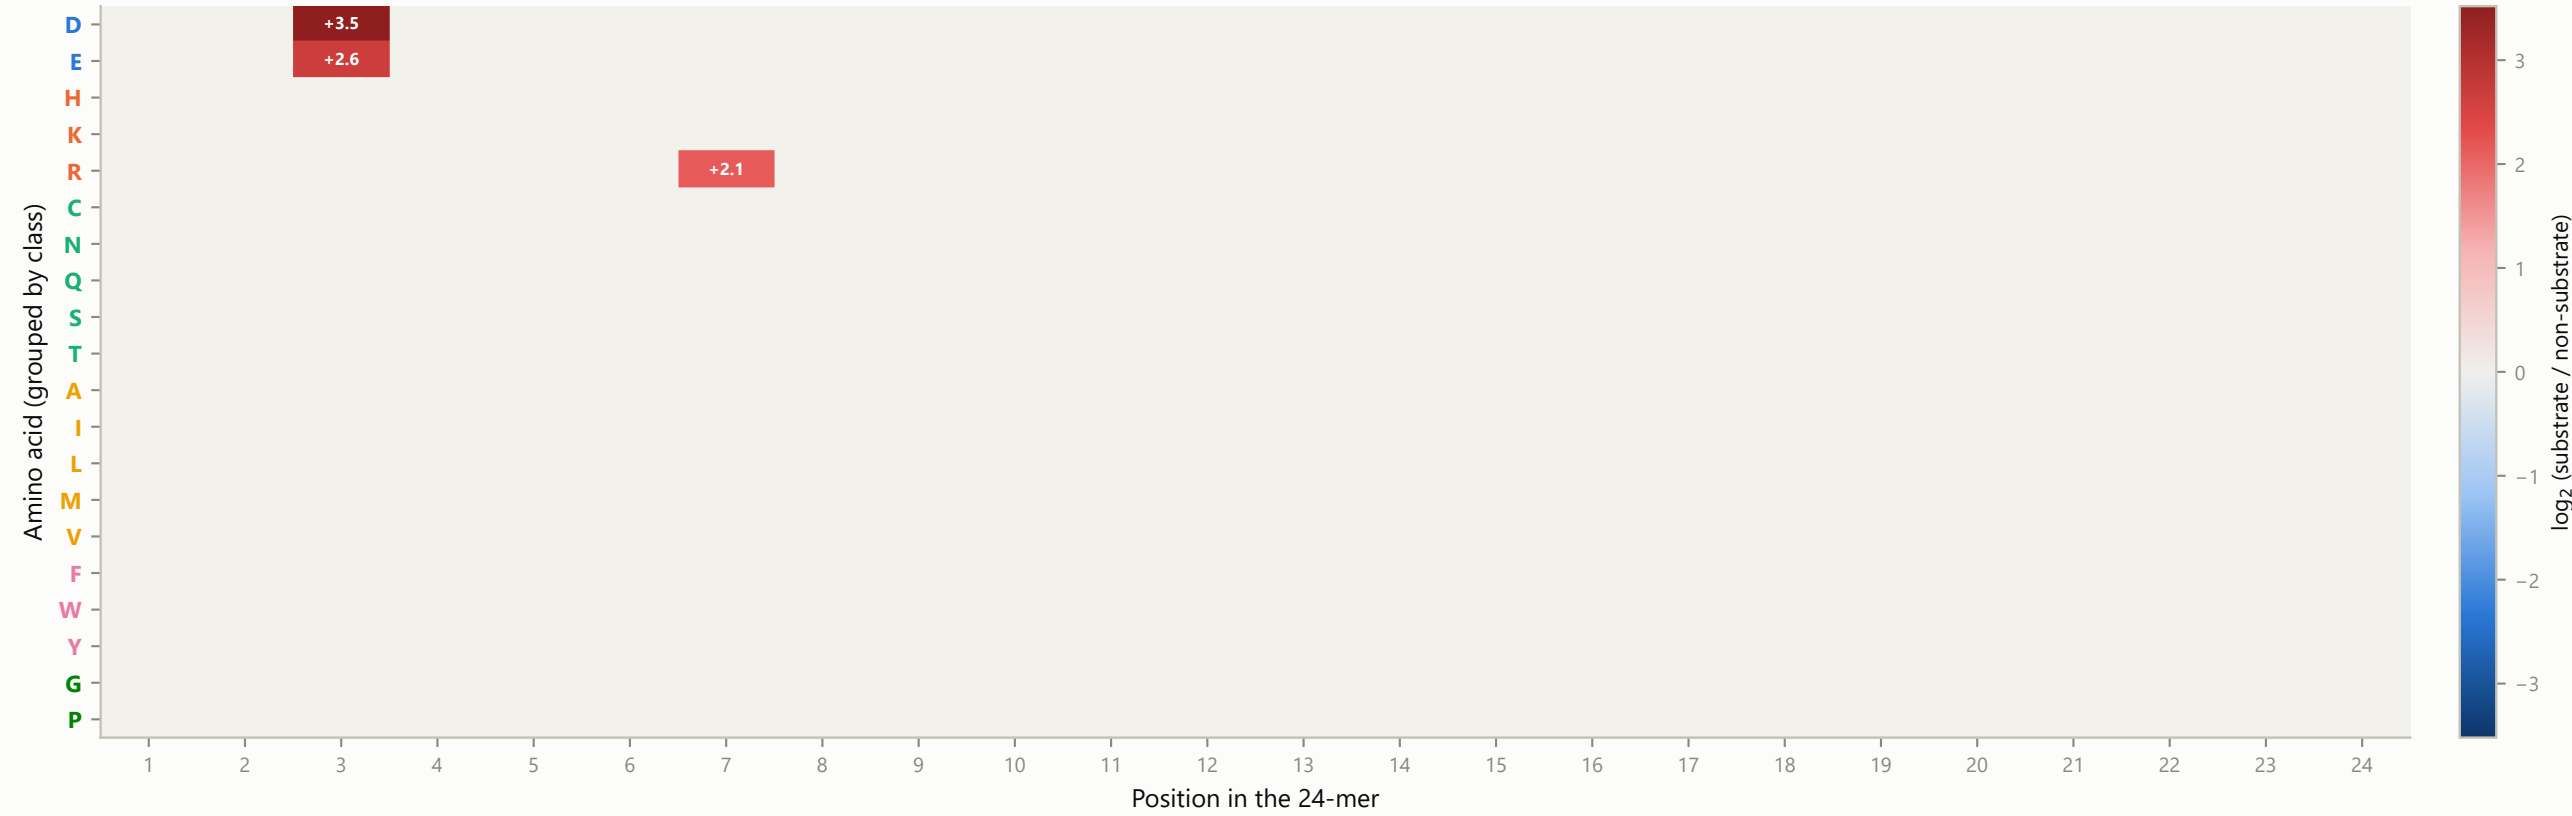

Beige = not significant. 1 of 144 cells survive $q < 0.05$: Acidic at position 3 only.

D

Residue enrichment, substrates vs non-substrates (FDR-masked)

3 of 480 cells survive $q < 0.05$: Asp and Glu at position 3, and Arg at position 7.

E

Downstream aggregate: only basic residues differ

Mean per peptide over positions 4-24. Net charge also separates them: +1.73 vs +0.36, $p = 0.0075$.
