

Met-Pro peptides — fold change, stabilised vs not stabilised (ZYG11B / ZER1 / double KO)

n = 36 stabilised Met-Pro peptides vs n = 424 Met-Pro peptides that are not stabilised. 25 of 440 cells reach $p < 0.05$ against 22 expected by chance alone, and none survives BH-FDR — nothing here is separable from noise.
