

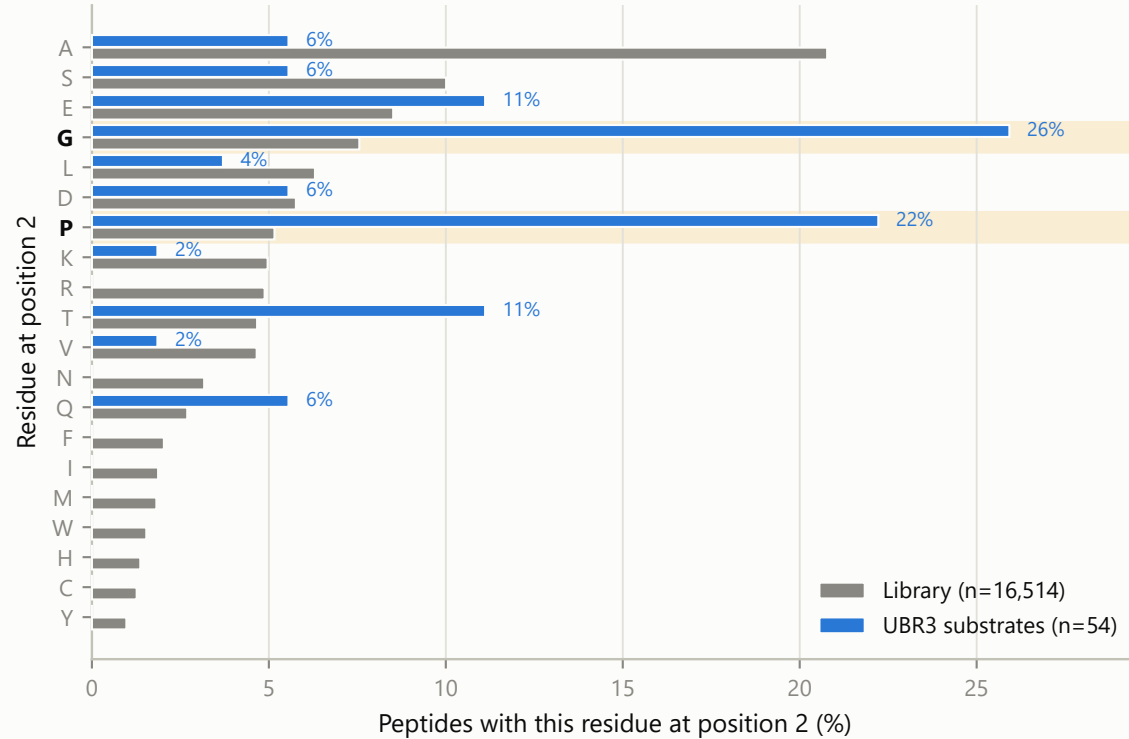

Figure 1 | Pro/Gly N-termini and the [P/G]-[E/D] motif in the N24mer stability screen

GPS screen of 16,514 human N-terminal 24-mers in control-KO vs UBR3-KO cells. Position 2 becomes the N-terminal residue after initiator-Met excision.

A

Position 2 is Pro/Gly in half the substrates

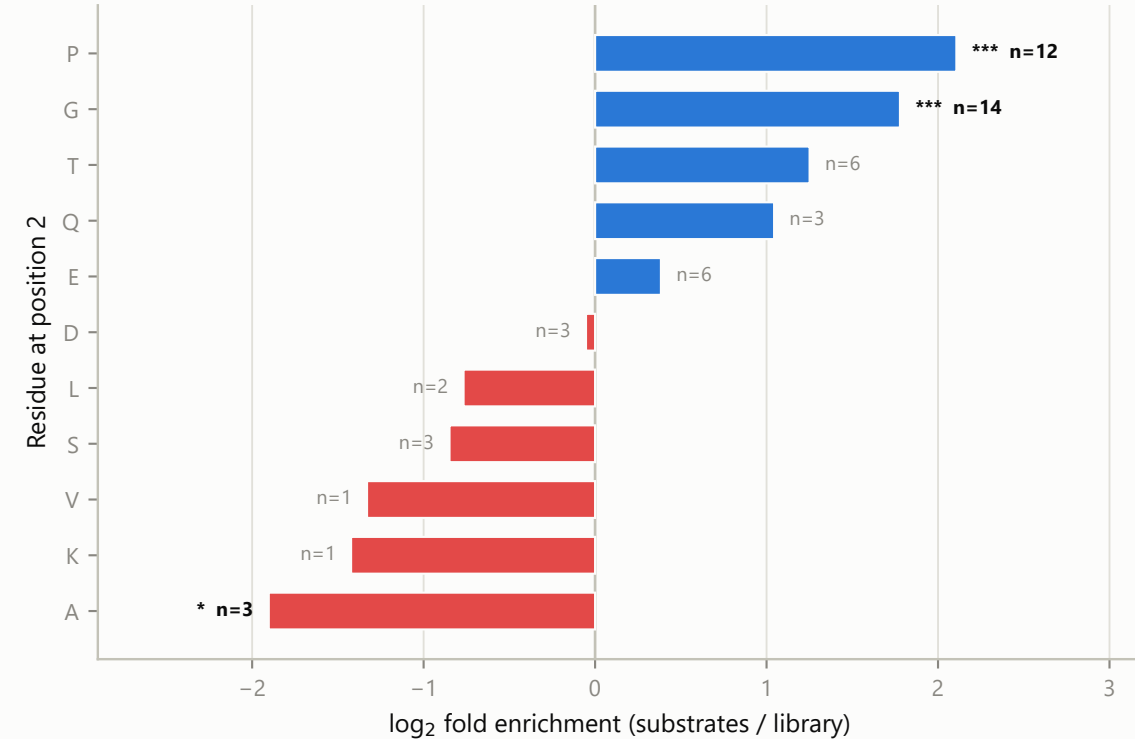

Shaded rows = Pro and Gly, the residues exposed after initiator-Met excision

B

Pro and Gly are the only enriched residues

Two-sided Fisher exact, Benjamini-Hochberg FDR; *** q<0.001, * q<0.05

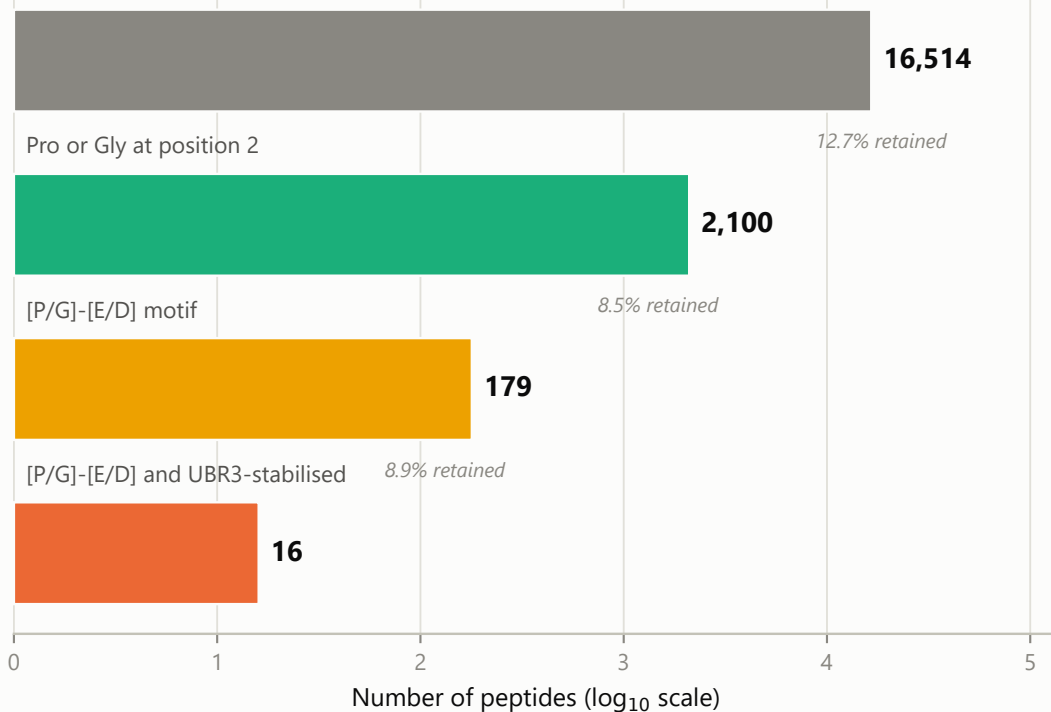

C

From 16,514 peptides to 16 motif-bearing substrates

Each bar is a nested subset of the one above it

All library peptides

D

The acidic residue at position 3 is what matters

Error bars are Wilson 95% confidence intervals; counts below each bar
