

Significance Logo — height is $-\log_{10} p$, not fold change (chi-square, as reported in the workbook)

n = 20 P/G-D/E/T substrates vs n = 193 non-substrate controls. Heights are uncorrected p: 25 of 416 cells reach $p < 0.05$ against 21 expected by chance, and only R7, R8 survive BH-FDR.
