
Significance Logo — height and colour are −log10 p, not fold change (chi-square, as reported in the workbook) — positions 3–11
−log10 p (stacked)
Position
−log10 p (floor: p = 0.05)
p = 0.001
p = 0.01
p = 0.05
n = 20 P/G-D/E/T substrates vs n = 193 non-substrate controls. Heights are uncorrected p: 12 of the 179 cells shown reach p < 0.05 against 9 expected by chance, and only R6, R7 survive BH-FDR. This is the N-terminal window only — positions 3–11, out to the 11th amino acid; q is still BH-FDR across all 416 cells of the full 3–23 matrix.
