

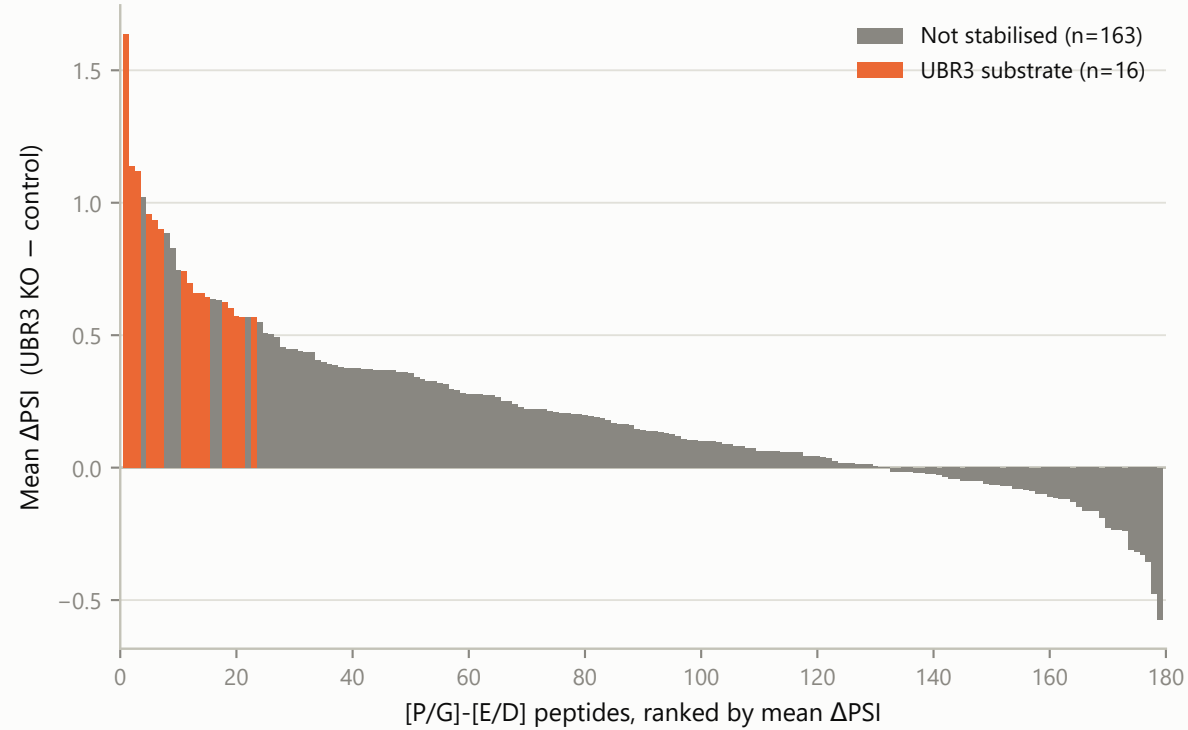

Figure 2 | The [P/G]-[E/D] motif is necessary but not sufficient for UBR3 regulation

Only 16 of the 179 library peptides carrying a Pro/Gly-initiated acidic motif are stabilised when UBR3 is lost - a 27-fold enrichment over background, but still a small minority.

A

163 of 179 motif-bearing peptides are not stabilised

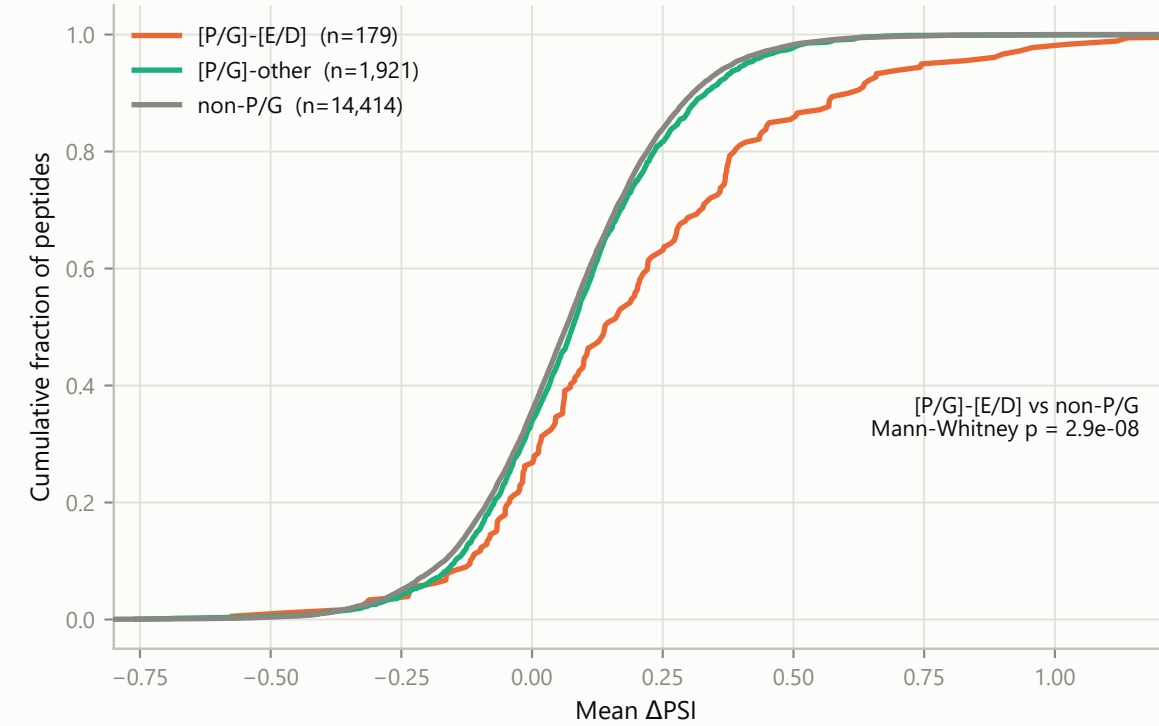

One bar per peptide; the 16 substrates are orange

B

The whole motif class shifts, but only slightly

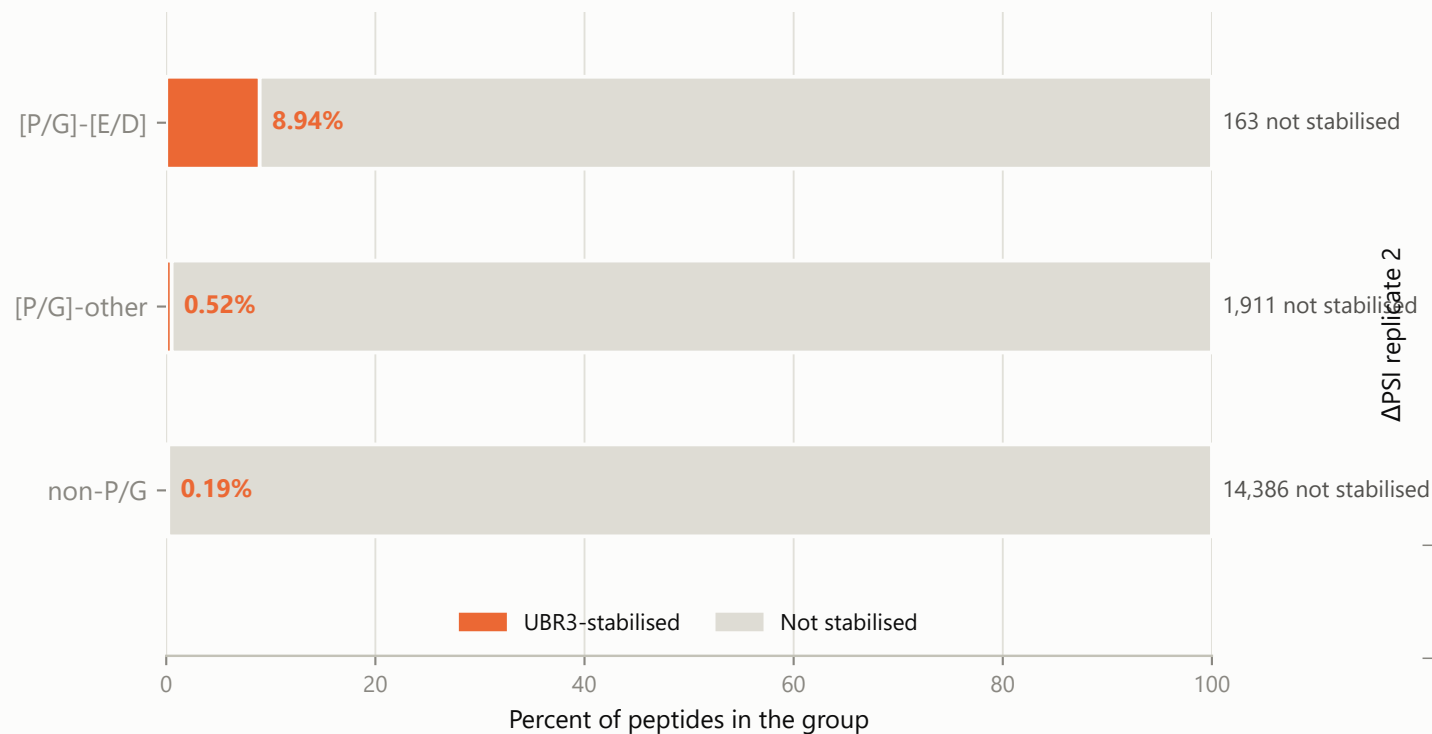

The [P/G]-[E/D] curve sits right of the other two, but the overlap is large

C

Motif enrichment is 17-fold, but the motif is not sufficient

Even in the best group, 91% of motif-bearing peptides are unaffected by UBR3 loss

D

Stabilisation is reproducible, not replicate noise

Both replicates plotted; the 16 substrates cluster together in the top-right corner
