

Met-Pro peptides — $-\log_{10} p$, ZYG11B and double KO only (ZER1-only calls dropped)

n = 26 stabilised Met-Pro peptides vs *n* = 424 Met-Pro peptides that are not stabilised. 16 of 440 cells reach $p < 0.05$ against 22 expected by chance alone, and none survives BH-FDR — nothing here is separable from noise.
